

PHYSICAL ACTIVITY, BODY COMPOSITION AND RESTING BRAIN ACTIVITY

Preliminary findings

Völgyi E.¹, Rezaie R.², Tylavsky F.A.¹, Hare M.E.^{1,2}, Papanicolaou A.C.²

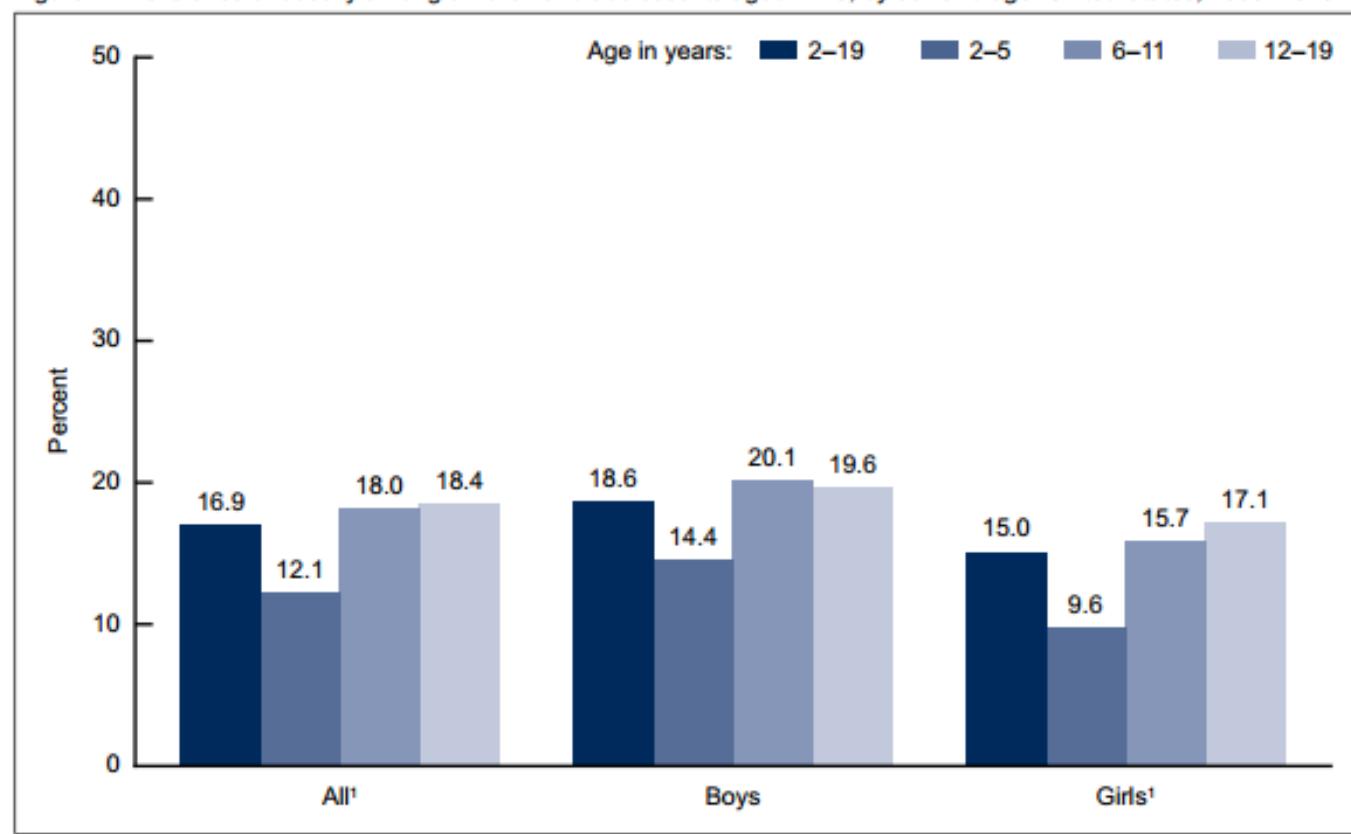

¹*Department of Preventive Medicine, University of Tennessee Health Science Center, Memphis, USA,* ²*Department of Pediatrics, University of Tennessee Health Science Center, Memphis, USA*

OBESITY IN THE U.S.

- More than one-third of U.S. adults (35.7%) are obese.
- 16.9% of U.S. children and adolescents are obese.

Figure 2. Prevalence of obesity among children and adolescents aged 2–19, by sex and age: United States, 2009–2010

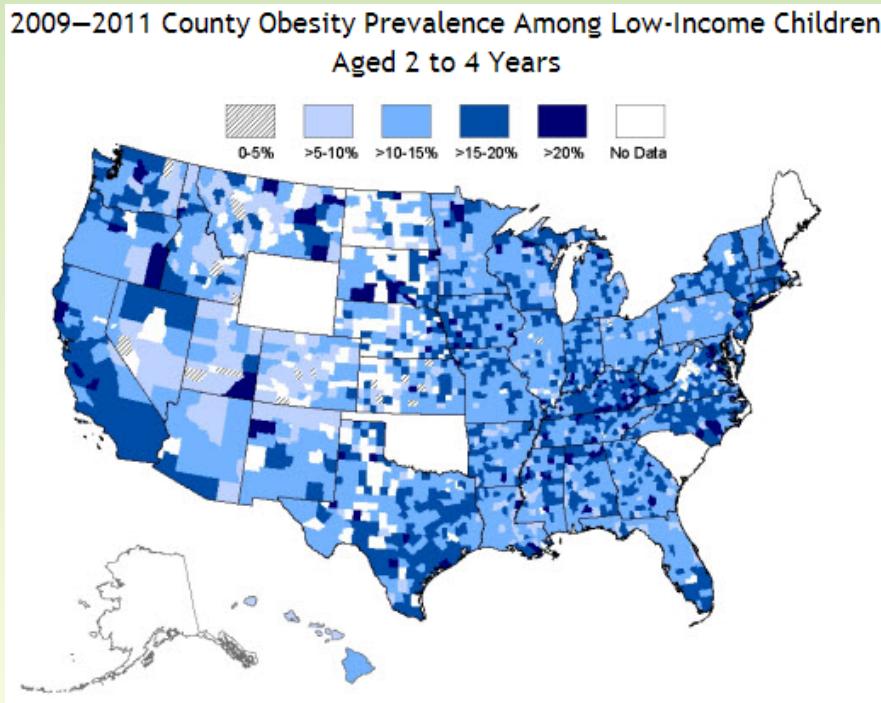

¹Significant increasing linear trend by age ($p < 0.005$).

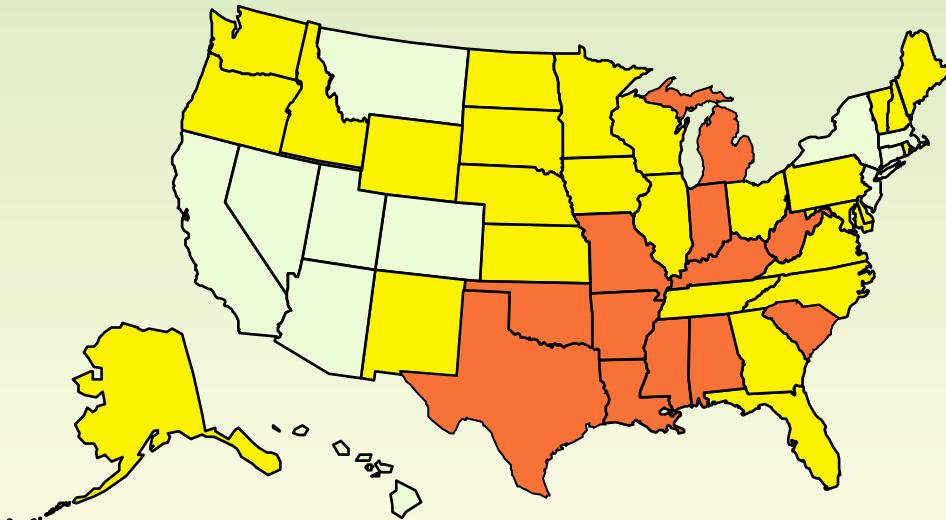

SOURCE: CDC/NCHS, National Health and Nutrition Examination Survey, 2009–2010.

OBESITY IN TENNESSEE

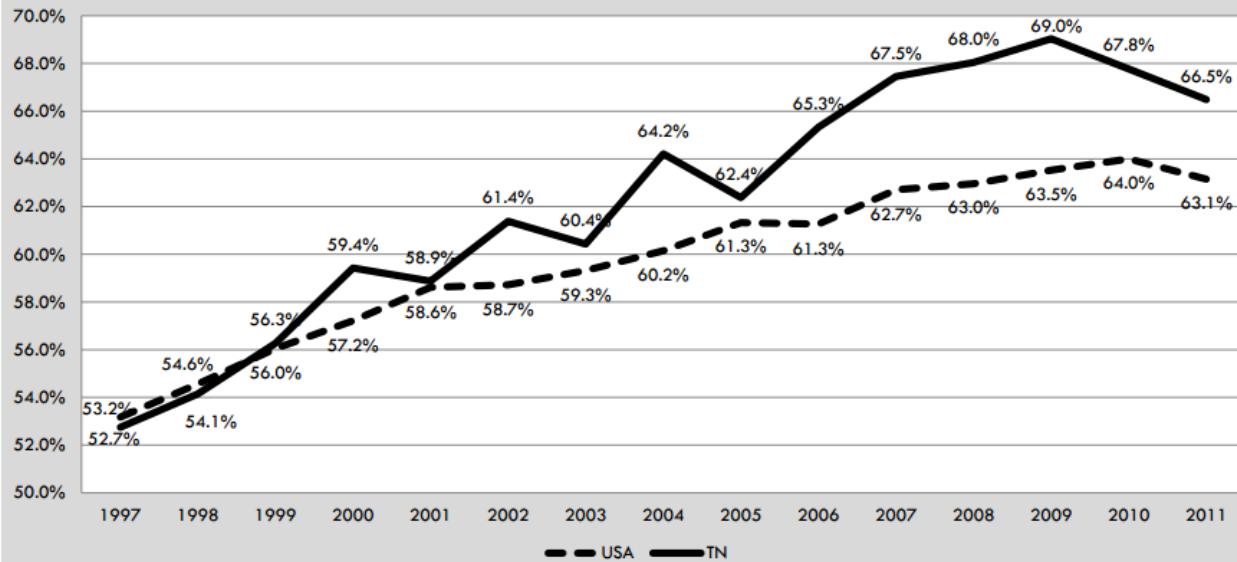

- One-third adults (32.8%) are obese (3rd).
- 36.5% of children and adolescents are obese (4th).
- 13.8% of children 2 to 4 years of age are obese.

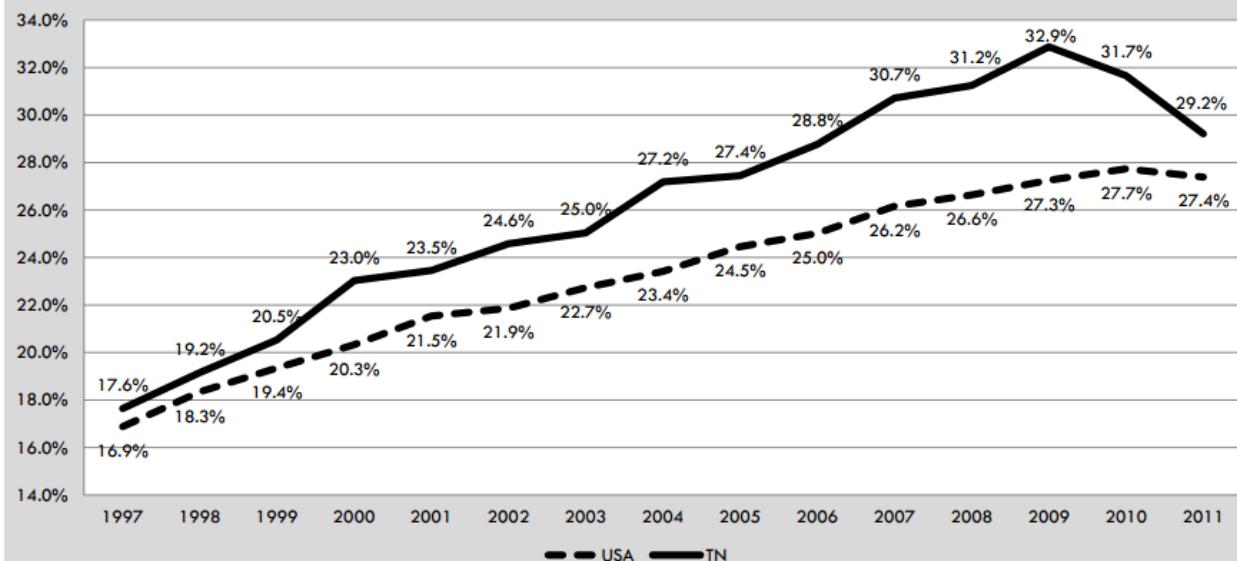

Prevalence* of Self-Reported Obesity Among U.S. Adults
BRFSS, 2011

Overweight Prevalence 1997-2011 US vs. TN

Obesity Prevalence 1997-2011 US vs. TN

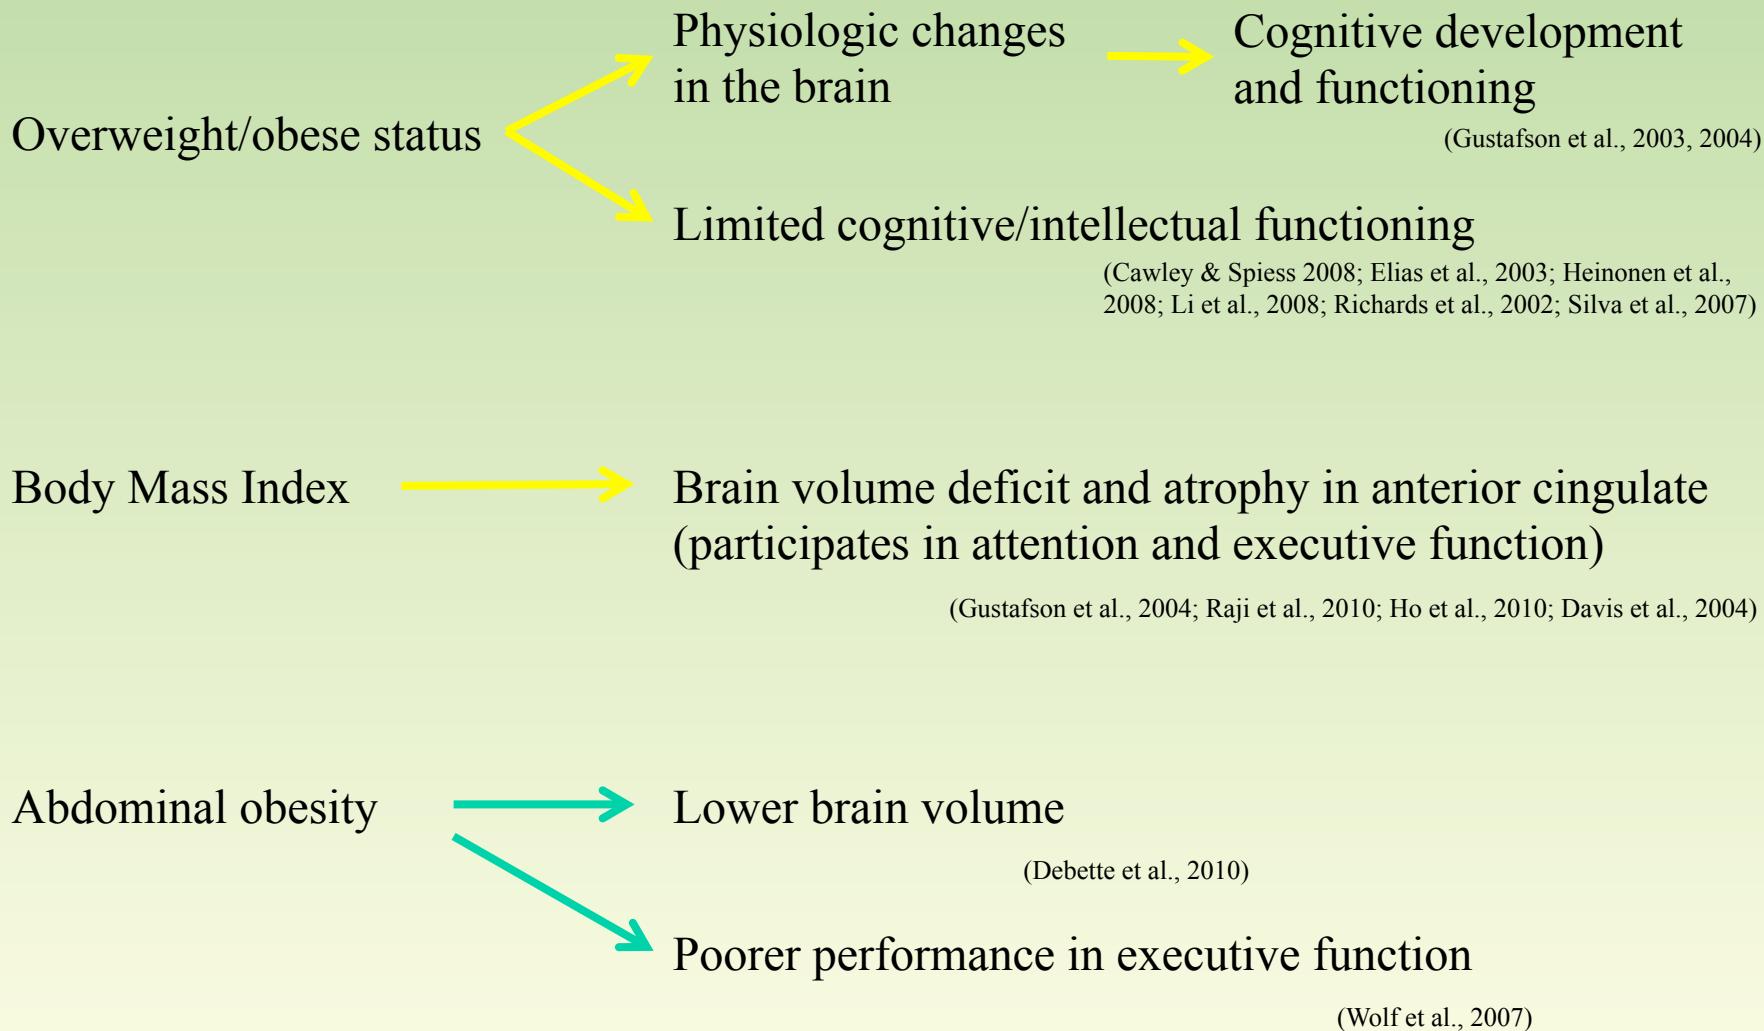

PHYSICAL ACTIVITY IN TENNESSEE AND THE U.S.

- **51.8%** of the adults are physically active in Tennessee (vs. 64.5%)
- **29.9%** of the adults are highly active in Tennessee (vs. 43.5%)
- 27.3% inactive (vs. 25.4%)

Students (grades 9-12):

- 24.3% active (vs. 17.1%)
- 30.4% daily physical education (vs. 30.3%)

ADIPOSITY AND COGNITION

PHYSICAL ACTIVITY AND COGNITION

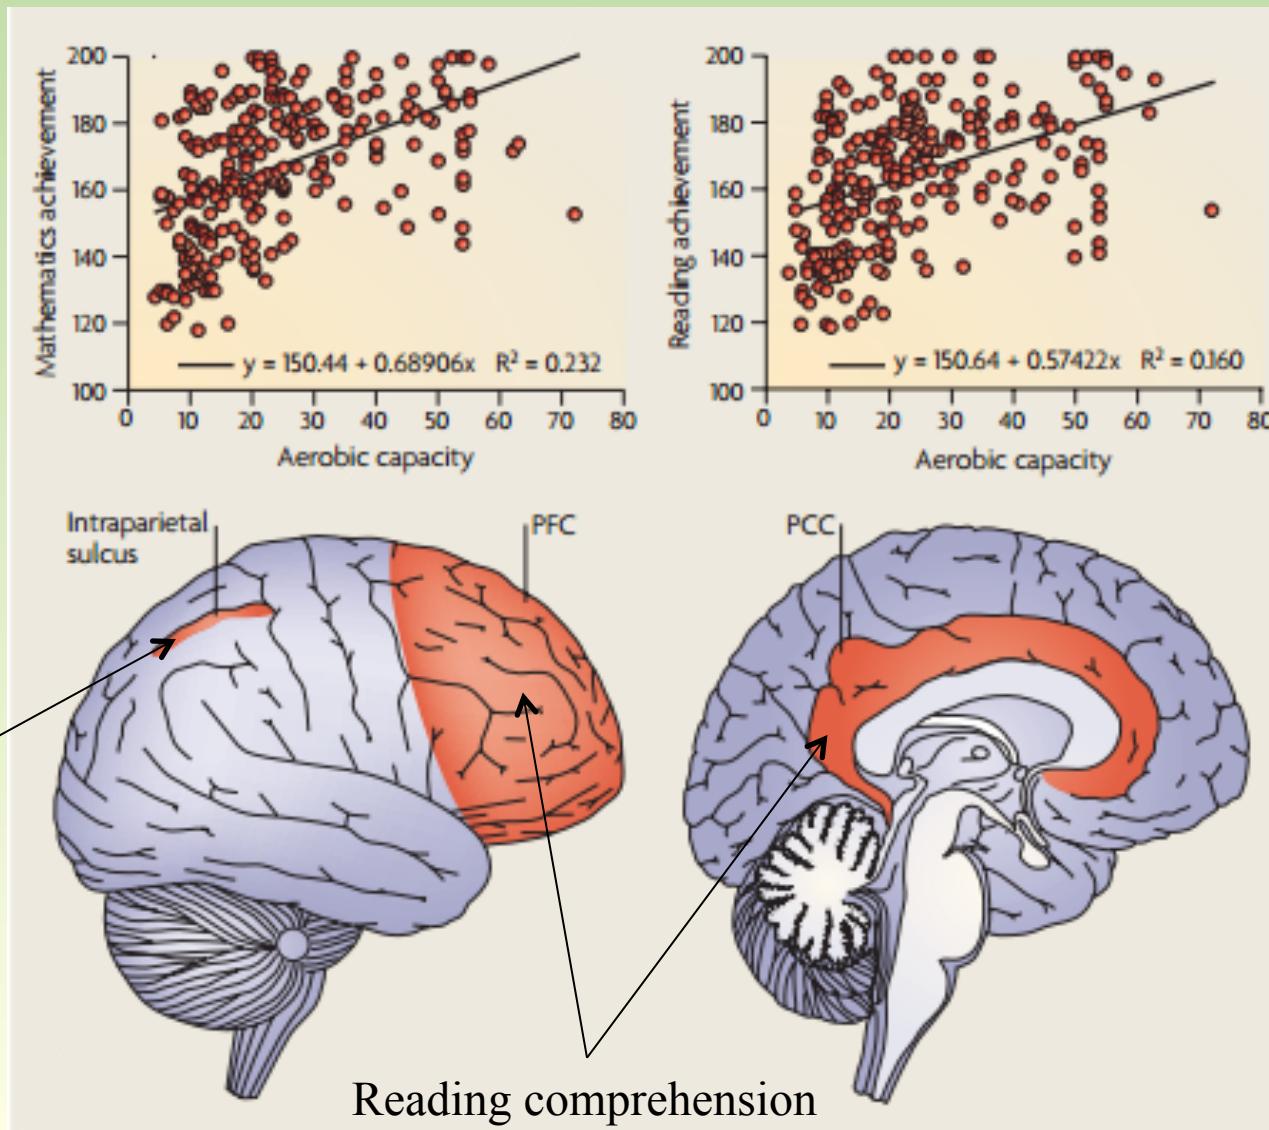

Exercise in middle childhood → ↑ Executive function (Davis et al., 2011)

Sedentary behavior before age 3 → Adverse effects on cognitive development at age 6
(mathematics score, reading recognition and reading comprehension)
(Zimmerman & Christakis 2005)

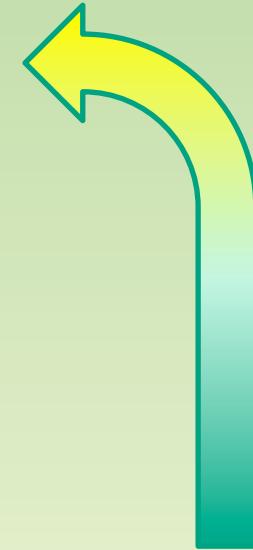

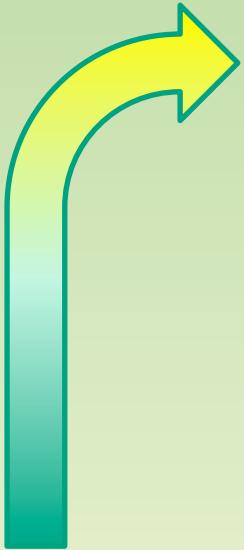

Aerobic physical activity → ↑ Cognitive performance in school-age children
(perceptual skills, intelligence quotient, achievement, verbal tests, mathematic tests, memory, developmental level/academic readiness)
(Sibley & Etnier 2003)

Fitness → Neurophysiological indices of attention and working memory and response speed, cognitive processing speed in children
(Hillman et al. 2005)

PHYSICAL ACTIVITY AND COGNITION

AIMS OF THE STUDY

The primary purposes are to examine the resting brain activity in relation to (1) % fat mass, (2) physical activity/inactivity and (3) cognitive development in a sub-group of 4-5-year old CANDLE children.

The secondary aims of this study are to examine:

- a) brain responses to tones;
- b) brain responses to speech sounds.

SUBJECT SELECTION

- Population Pool:
 - 4-5 yr. olds who participate in the Preschool CANDLE visit
- Meet the inclusion/exclusion criteria:
 - Born full term (37-42 weeks gestation)
 - BMI percentile $>5^{\text{th}}$
 - Neonatal stroke
 - Grade IV intraventricular haemorrhage
 - Periventricular leukomalacia
 - Prenatal drug exposure
 - Possible autism (M-CHAT at CV2)
 - Hyperactivity-attention problem (CBCL-3 at CV3)
 - Metal, internal hardware in the body
 - Serious head injury, unconsciousness for more than 2 min
 - Refused consent

PHYSICAL ACTIVITY/INACTIVITY

ACCELEROMETER:

ActiGraph, GT1M
Pensacola FL, USA

- Measures acceleration in the vertical plane
- Noninvasive
- Activity counts, steps taken and intensity of exercise
- 7 consecutive days (3 days used for analysis)
- Sedentary- and light-, moderate- and vigorous
- ***Study questionnaire:*** Screen time and media use
Extra curricular physical activity

DUAL ENERGY X-RAY ABSORPTIOMETRY

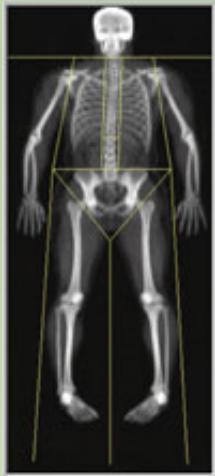

image taken from hologic.com

Hologic Inc., Waltham MA, USA

- Reference method
- Noninvasive assessment of % Body Fat
- 3 minutes to measure whole body

TBAR1207

MAGNETOENCEPHALOGRAPHY (MEG)

Le Bonheur's MEG Clinic

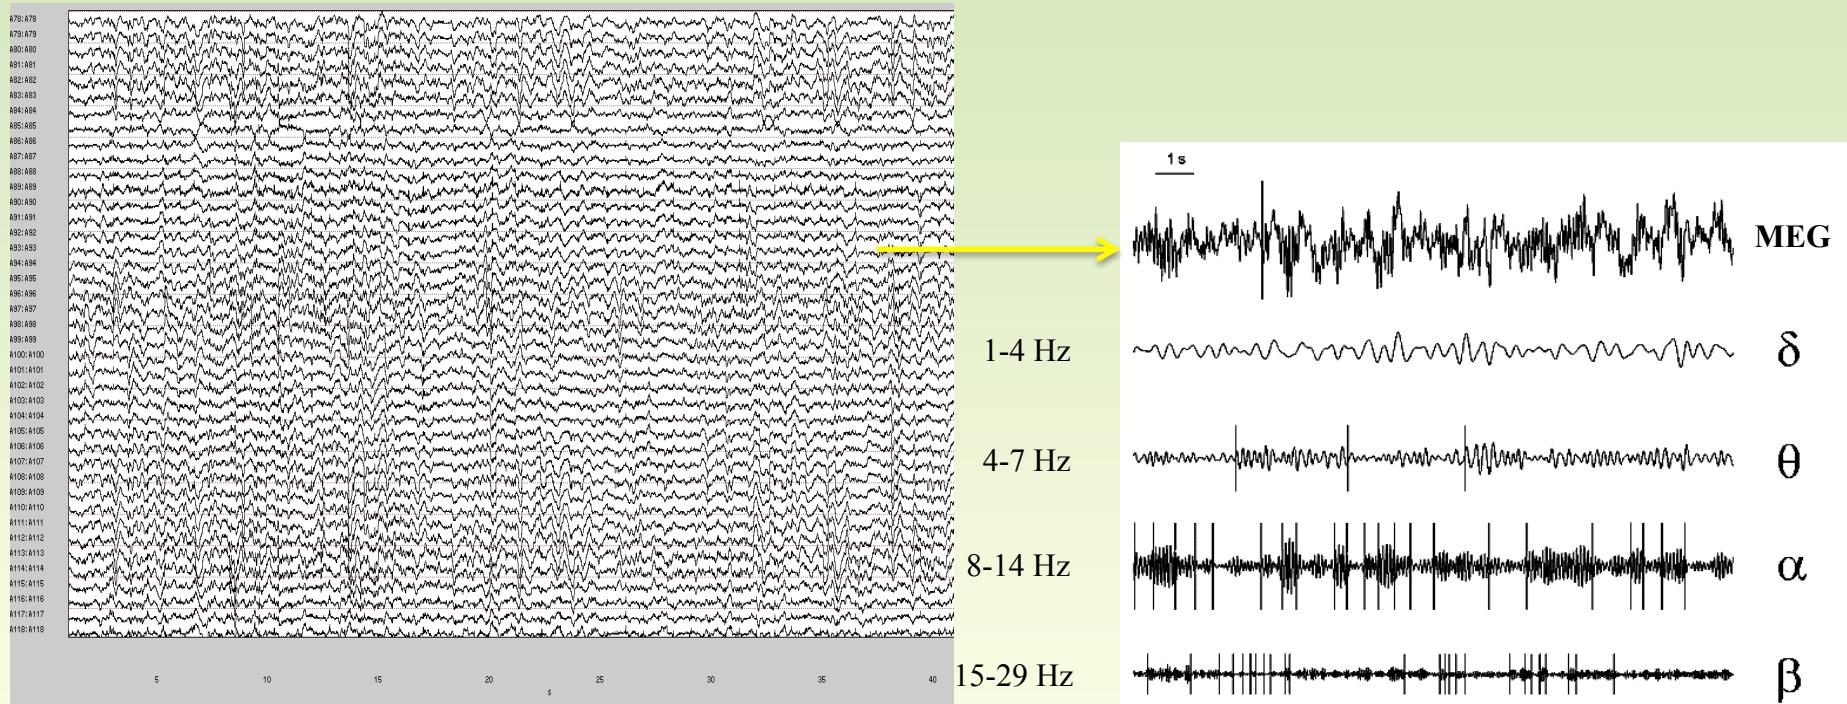

- (1) MEG is a noninvasive functional mapping technique
 - (2) Derives profiles of brain activity based on changing magnetic fields associated with neural activity.

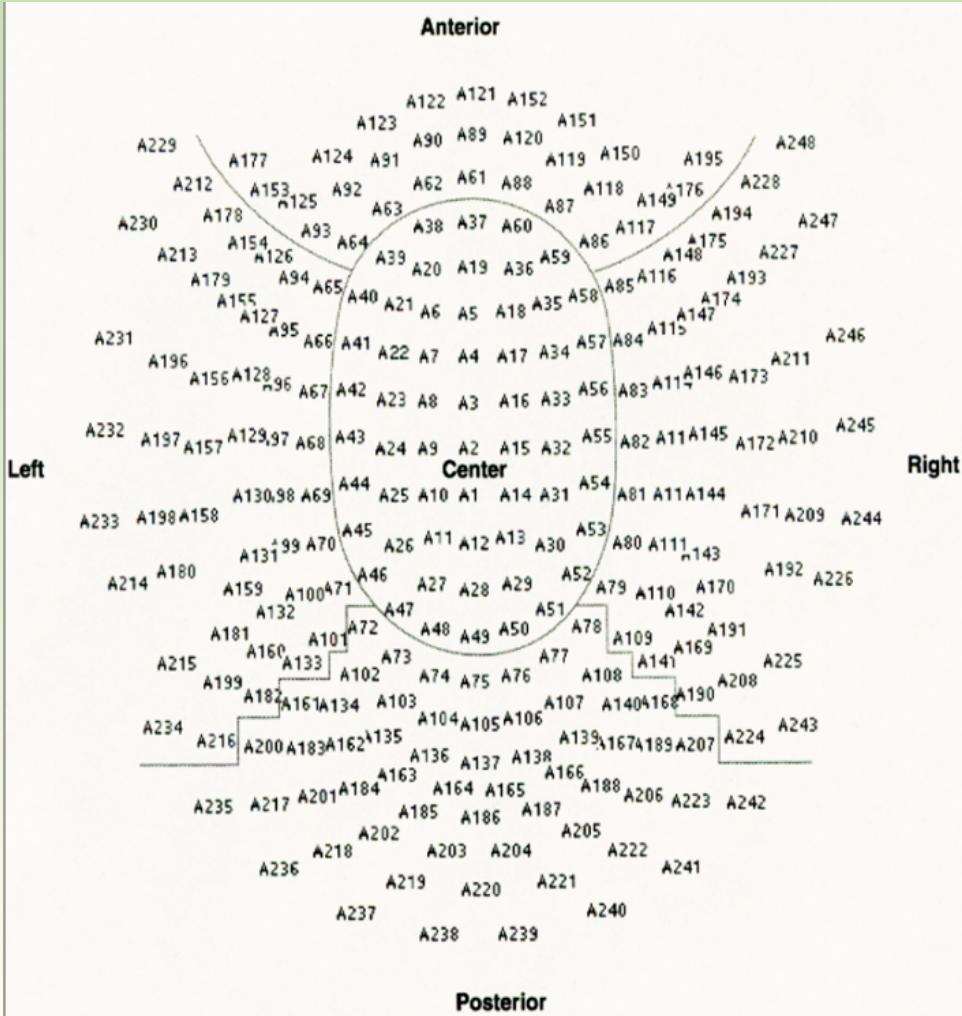

MEG METHODS

- Fast-Fourier Transform (FFT)
 - Decomposing a sequence of values into components of different frequencies. (5 x 5sec EPOCH)

MEG METHODS

LEFT HEMISPHERE

Posterior				

PHYSICAL ACTIVITY AND NEUROIMAGING

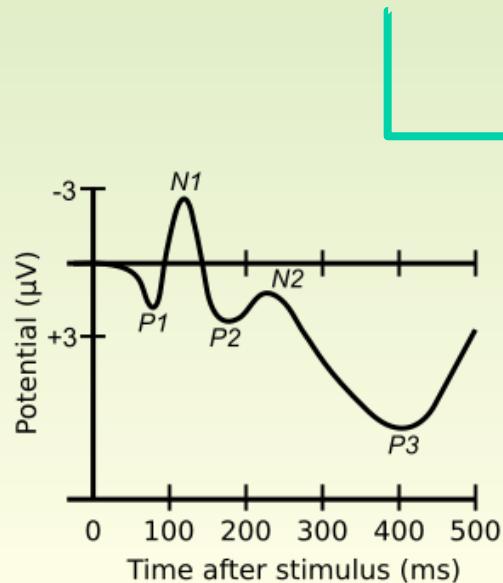

Baseline spectral frequency distribution analysis (EEG)

Better aerobic fitness

↑ mean frequency Delta, Theta, Beta
↑ activation Theta, Alpha, Beta

(Bashore 1989, Dustman et al. 1985, 1990, Lardon & Polich 1996)

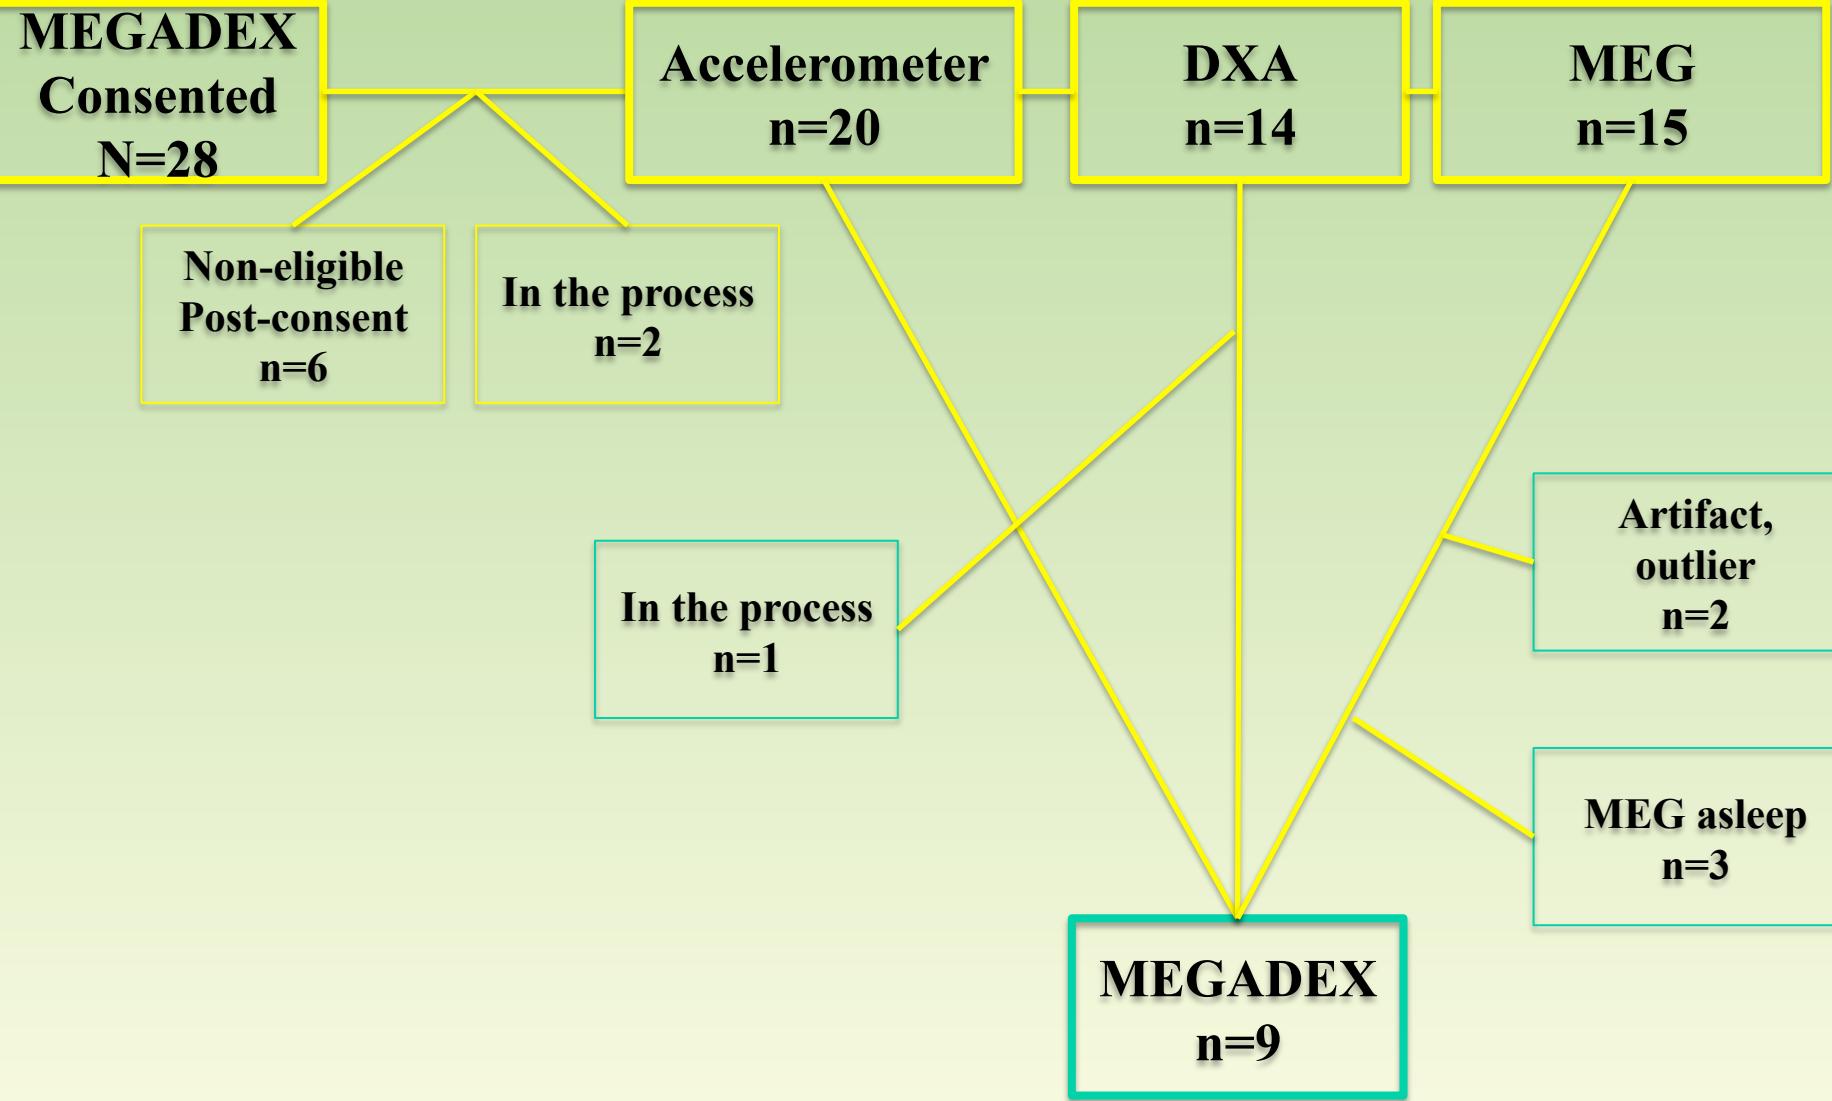

Inter-individual variability of baseline spectral frequency activation

Individual variation of P300 component of the ERP

(Mecklinger et al. 1992, Polich & Lardon 1997)

P300 (P3) : Higher cognitive response to unexpected and/or cognitively salient stimuli.

SUBJECTS

Table 1. Basic characteristics of the study participants

Characteristics	MEAN ± SD	RANGE
Mother's Age (yrs)	28.0 ± 4.4	22-39
Mother's IQ	88.9 ± 20.57	60 -126
Mother's BMI (kg/m^2)	32.9 ± 11.1	21 - 60
Race/Gender	77% AA, 60% girl	
Child's Age (months)	53.5 ± 5.4	46 – 62
Height (cm)	107.8 ± 4.9	98 - 115
Weight (kg)	20.3 ± 6.1	15 - 38
BMI for Age percentile	61.5 ± 28.1	14 - 100
VIQ percentile	44.3 ± 26.6	5 - 86
NVIQ percentile	43.7 ± 30.2	3 - 96
FSIQ percentile	43.1 ± 27.0	3 - 88

BODY COMPOSITION RESULTS

Table 2. Body composition of the study participants

Characteristics	MEAN \pm SD	RANGE
Mother's BMI (kg/m^2)	32.9 ± 11.1	21 - 60
BMI for Age percentile	61.5 ± 28.1	14 - 100
Fat Mass (kg)	4.7 ± 3.1	2- 13
Fat Mass (%)	26.2 ± 8.9	13 –39
Lean Mass (kg)	11.5 ± 1.7	9 – 14

PHYSICAL (IN)ACTIVITY RESULTS

Accelerometer:

- Average steps/day: $8,359 \pm 3,005$ (4,077-15,391)
- 10.3 ± 1.9 hrs/day in sedentary and light activity
- 1.3 ± 0.4 hrs/day in moderate exercise
- 0.5 ± 0.3 hrs/day in vigorous exercise

12,000 STEPS/DAY

Questionnaire:

- 79% of the children were active at least for 60 min 5 times a week
- 64% watching TV at least 2 hrs per weekday,
- 50% watching TV at least 2 hrs per weekend day.
- On average children spend 2.3 hrs in screen time (watching TV, playing video games) on a weekend day and 2.5 hrs on a weekday.

2 HRS/DAY

SUMMARY

FAT MASS	LEAN MASS	BODY MASS	FAT MASS (%)	BMI pct
----------	-----------	-----------	--------------	---------

Babiloni et al. 2011 suggest that abnormal weight in healthy overweight/obese subjects is related to abnormal cortical neural synchronization at the basis of resting state **alpha rhythms** and fluctuation of global brain arousal.

Baseline spectral frequency distributions of electroencephalograms (EEGs) has revealed increased activation in the **theta, alpha and beta** spectral bands, and higher mean frequency in the **delta, theta and beta** bands in more active or aerobically fit individuals. (Bashore 1989, Dustman et al. 1985, 1990, Lardon & Polich 1996)

FUTURE

CONCLUSIONS

- Imaging studies require lot of patience, time and effort
- It is very easy to “lose” sample size due to artifact etc.
- Our results are very promising, we will be able to challenge papers published in high IF journals
- The research area is still new, there is a lot that has to/can be done
- The topic is “hot”

Advantages/availabilities:

- Most inactive state
- Very obese state
- Special population
- Unique cohort study with extensive cognitive measures

MEG II Summary

- 8 subjects
- 6 subjects with brain recording
- Current analytical strategies:
 - Relationship between resting brain activity (e.g. FFT) and stress levels (cortisol from saliva)
 - Differentiation between developmentally delayed and normally developing children, using FFT
 - Parallel investigation of neurophysiological markers unique to developmentally delayed and normally developing children using novel **functional connectivity analysis**

Also, it provides an opportunity to establish, cross-sectional, normative profiles of connectivity which at present is lacking in the literature.
